

Non Intrusive Contact Sharing

CS 339
Mac Finnie '16

motivation

Exchanging contact information is a dated and largely manual process, why?

Security - We have a “standard” encoding of when to share contacts.

motivation

What is this encoding?

Gesture - One way of initiating contact sharing is through a gesture, such as a handshake.

Language Processing

motivation

What is there to gain from an automated digital exchange?

Data - Increased amount of information about each encounter. Learn and predict.

concept

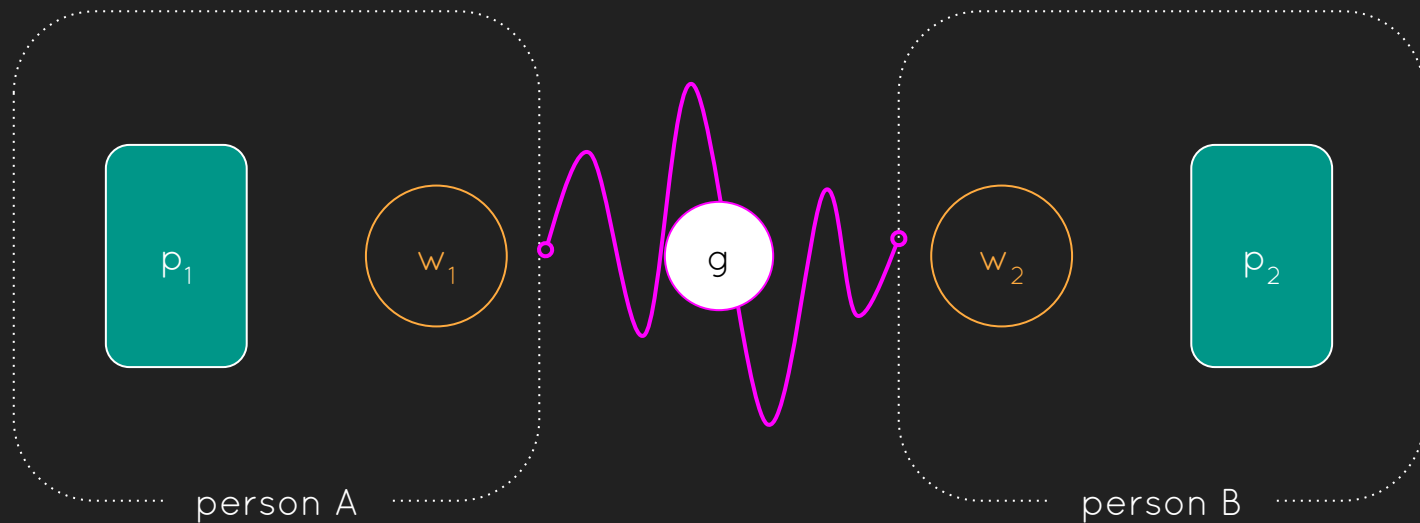

How do we recognize a gesture?

Accelerometer - Pebble Smartwatch

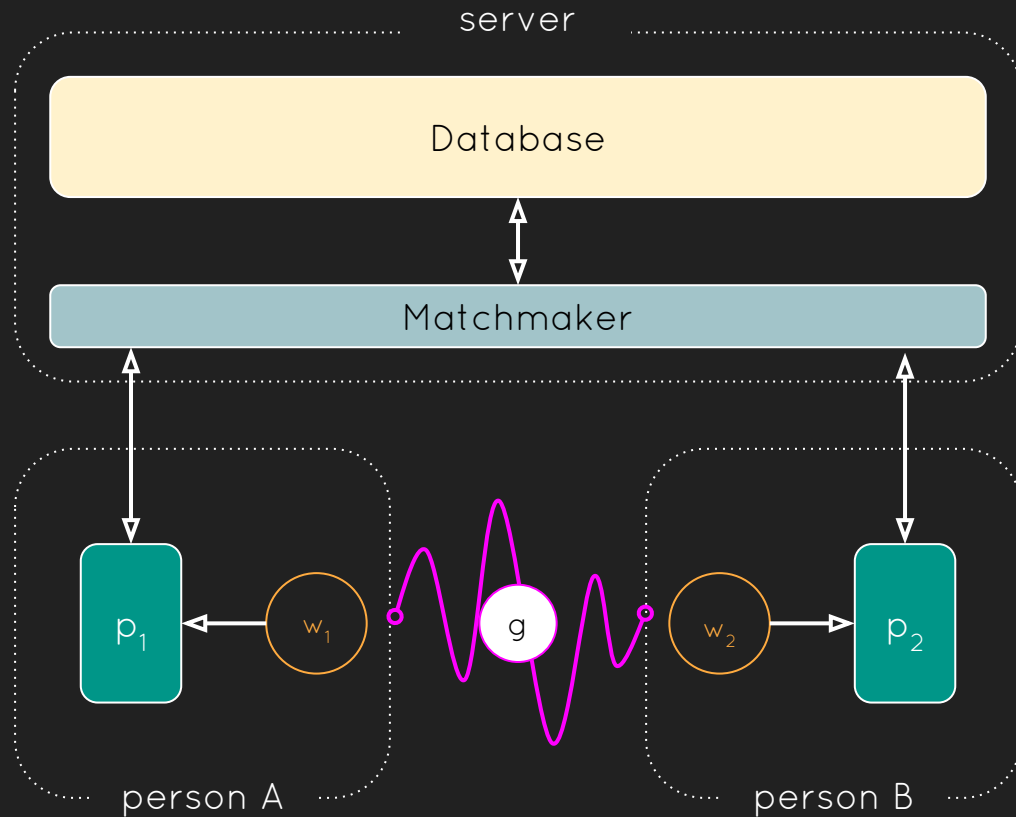

architectural overview

architectural overview

architectural overview

architectural overview

components

1. sensor running on watch (C)
2. phone collecting sensor data and requesting pair (java & javascript)
3. web service (Apache2)
4. matchmaker (PHP)
5. database (MySQL)

demo

database partitioning

why?

- I. single table is inefficient
- II. optimize queries - only look where is most likely
- III. data organization

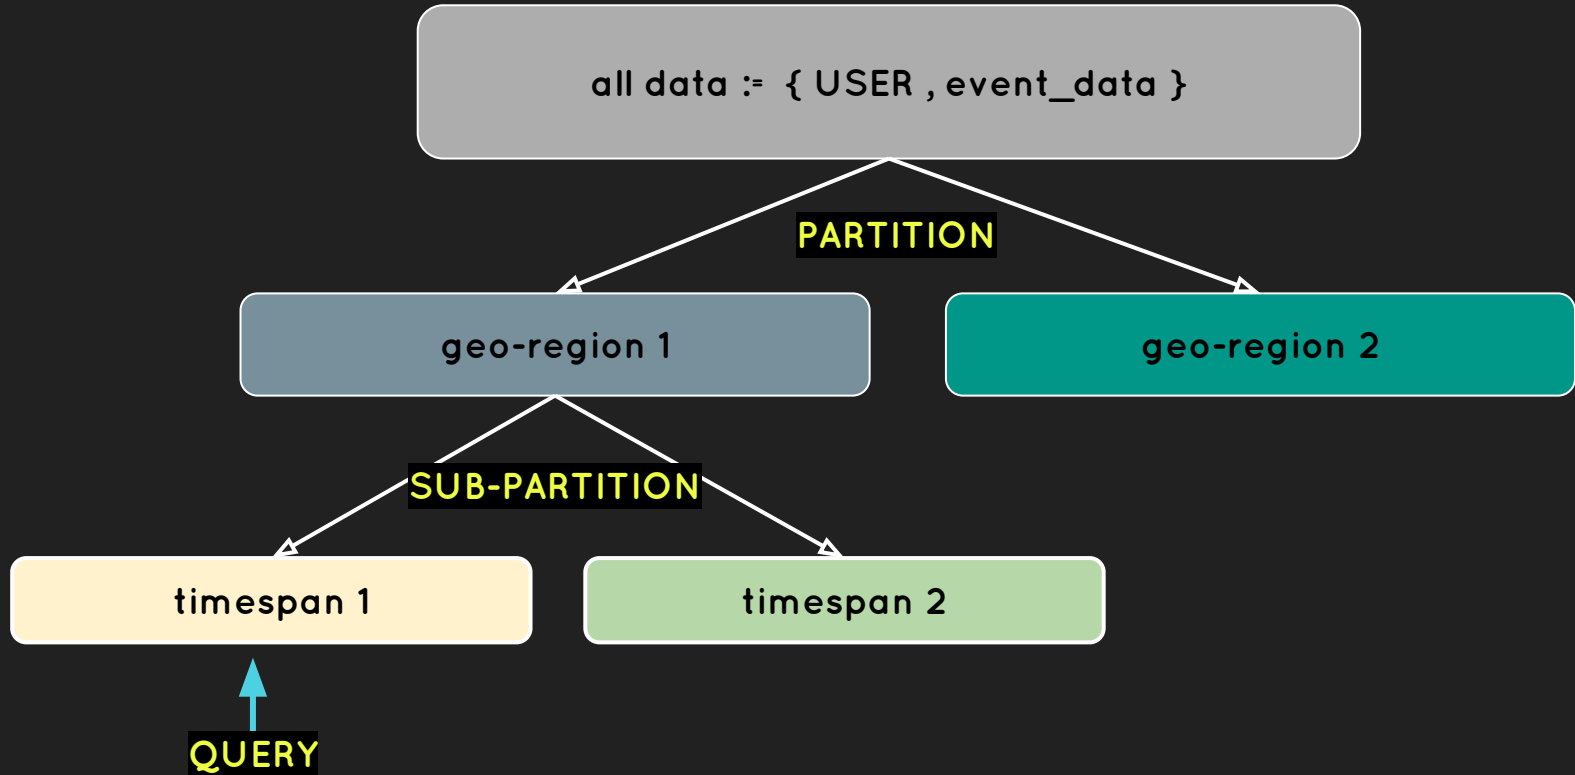

database partitioning

how?

horizontally partitioning each table by
assigning a row to a partition of the file
system

subpartition to create a hierarchical
structure

database partitioning

future direction

1. expand recognized gestures
2. rethink system design (p2p)
3. increase point of contact data
4. learn and predict
(both partitioning and user experience)
